what is elasticsearch api?

Elasticsearch is a search engine based on the Lucene library. It provides a distributed, multitenant-capable full-text search engine with an HTTP web interface and schema-free JSON documents. The Elasticsearch API allows you to interact with Elasticsearch by sending HTTP requests to its endpoint. These requests can be used to perform operations such as creating, reading, updating, and deleting documents, as well as performing search and aggregation queries. The API can be accessed using a variety of programming languages, including Java, Python, and JavaScript, through Elasticsearch clients such as the official Elasticsearch client for Java or the Elasticsearch.js client for JavaScript.

what is elasticsearch api?

Elasticsearch API is a set of RESTful endpoints provided by Elasticsearch that allows you to interact with an Elasticsearch cluster using HTTP methods. The Elasticsearch API provides many operations like indexing, search, and aggregation that can be performed by sending HTTP requests to Elasticsearch nodes. The API endpoints are designed to be simple and easy to use, and they can be accessed using any programming language that can send HTTP requests. The API can be used to perform a wide range of tasks, including creating, reading, updating and deleting documents, as well as searching, aggregating and managing the cluster itself. You can find more detailed information about the Elasticsearch API in the official Elasticsearch documentation.
