what is text analysis in elasticsearch?

Text analysis in Elasticsearch refers to the process of breaking down text into smaller components (tokens) and processing them in order to make the text more amenable to search and other forms of analysis. This process typically involves steps such as tokenization, lowercasing, and stemming or lemmatization, and can be customized using various text analysis plugins. The resulting tokens are then indexed, allowing for efficient search and other types of analysis (e.g. aggregation) on the text.

what is text stemming or lemmatization in elasticsearch?
