All CSS properties have 3 basic values in common: inherit, initial and unset. Inherit and initial have been around for a long time, but unset is a new addition. What the values will do can at times get confusing, so here’s a breakdown:

- **inherit**: Get the property from the parent element.
- **initial**: The default value for the property (the browser default).
- **unset**: Acts as either inherit or initial. It’ll act as inherit if the parent has a value that matches, or else it will act as initial.

Here’s an example to make is clear. Here’s our markup:

```
<div class="wrapper">
  <p class="one">Snake<p>
  <p class="two">Lizard<p>
  <p class="three">Alligator</p>
  <p>Komodo Dragon</p>
</div>
```

Copy

```
p.one { color: inherit; }
```

```
p.two { color: initial; }
```

```
p.three { color: unset; }
```

- **Snake** is orange, it inherits from the wrapper div.
- **Lizard** is black, it takes the initial browser default value.
- **Alligator** is orange, in this case unset acts as inherit because there is a parent with a matching value.
- **Komodo Dragon** is purple, the only paragraph that takes its value from the .wrapper p selector.

👉 A neat trick with unset is when combined with the all shorthand, which automatically affects all properties of a selector. The following unsets every properties of the selected p elements:

```
article p {  
  all: unset;  
}
```

I always see these values in editor's auto-suggestion but never understood what they meant and also I never had to use them. But this is enlightening to know that they have a meaningful function. 🙌
