what is web-safe font in css2

Web-safe fonts refer to the set of fonts that are commonly available across different operating systems and devices, and are therefore more likely to be displayed consistently across various web browsers. In CSS2, the web-safe font families are:

1. Arial, Helvetica, sans-serif
2. Times New Roman, Times, serif
3. Courier New, Courier, monospace
4. Verdana, Geneva, sans-serif
5. Georgia, serif
6. Palatino Linotype, Book Antiqua, Palatino, serif
7. Comic Sans MS, cursive
8. Tahoma, Geneva, sans-serif
9. Trebuchet MS, Helvetica, sans-serif
10. Impact, Charcoal, sans-serif

These fonts were considered to be the most common and widely available on various platforms at the time when CSS2 was developed. However, with the proliferation of mobile devices and the advancement of web technologies, the use of web-safe fonts is not as critical as it used to be. Nowadays, web designers and developers have more flexibility in choosing from a wider range of fonts, using web font services, or even embedding custom fonts on their websites.
