How To Differentia Between Web And Api Routes In Laravel

Posted By Bajarangi soft , Posted On 18-01-2021

In Laravel we have two routes separate file one is web.php and api.php .So today we discuss what is the difference between web.php file and api.php file

Difference Between Web.php And Api.php Files In Laravel

Differentia Between Web And Api Routes In Laravel

Web.php	API.php
The routes/**web**. **php file** defines routes that are used to build front end and backend also **web** interface.	routes/**api**. **php file** is used when you want to make a Restful **API** and to develope backend of project.
These routes are assigned the **web** middleware group, which provides features like session state and CSRF protection.	The routes in routes/api are stateless and does it mean api routing is not using session state, CSRF protection
Web routes, are used when we want to return views.	**Api routes**, are used when we want to return json (Api resource/collection).
A web `POST`/`PUT` request would also create/update some entity but would usually return a redirect to a new page	An API `POST`/`PUT` request would create/update some entity and return a JSON response, like a newly created model for `POST`, or an updated model for `PUT`

submission will send your form-data to the given endpoint, and it will return the response directly to your browser	status 200 with a JSON representation of the model you just created/updated. Your javascript code then decides what to do next, like closing a popup window
Example:	Example:

```
public function index()
{
    return view('home');//
return to page
}
```

```
public function index()
{
    return response()->json($model);//
response with status
}
```
